Fernwood Science, Year 7: The water cycle

Water moves between the sea, the air,
and the land in a cycle that never stops.
The sun warms the sea, and some water
evaporates: it turns into water vapour,
an invisible gas, and rises.
High in the air the vapour cools.
It condenses into tiny drops of water,
and the drops gather into clouds.
This step is called condensation.

When the drops in a cloud grow heavy,
they fall as rain, snow, or hail.
This step is called precipitation.
Rain that falls on land runs into
rivers, or soaks into the ground,
and most of it returns to the sea.
Then the sun warms the sea again,
and the cycle starts once more.
Question: what makes water evaporate?
